# About TransAxle

## What is the Difference Between Remanufactured and Rebuilt...

Today's fleet equipment is increasingly sophisticated & expensive. It's imperative that the components used in repair are of sufficient quality to return the vehicle to original equipment (OE) performance levels.

Many customers question the difference between remanufactured and rebuilt. An excellent perspective comes from Jim Morrow, former president of Detroit Diesel Remanufacturing Corp. "First of all, let's clarify the difference between a remanufactured transmission and one that is rebuilt. TransAxle transmissions are totally remanufactured, returning them to the latest blueprint specifications and tested to original equipment standards," explains Morrow. "The typical rebuilt transmission is only repaired to the level of failure. That means any components beyond this level are left intact. Additionally, testing procedures often vary among individual rebuilders. Having been exposed to TransAxle's process, I can attest that they have a robust remanufacturing and testing process—they are not a rebuilder"
